

Passket

A Secure yet Transparent way to store your password

Passket

A Secure yet Transparent way to store your password

Passket (Password-Bucket) is a password manager which stores all of the user's password in an encrypted way which even "we" can't access to it. Passket uses AES128 cipher algorithm to encrypt all the user's data.

This is implemented using NextJS (With Typescript), MongoDB, Python and Supabase.

Passket

A Secure yet Transparent way to store your password

As most of the users save their password in Notes app or with Google Password Manager, If the device gets compromised then its **GAME OVER**. Thats why we made Passket which requires a specific pin (like UPI pin) to access your passwords everytime.

So even if the device gets compromised, your passwords won't. It's also synced across devices so you can easily access it from anywhere, anytime.

Passket

A Secure yet Transparent way to store your password

So we are using AES128 algorithm to encrypt/decrypt passwords. This is done by the client and not on our servers. AES is a commonly used cipher algorithm used across websites to encrypt data that needs to get decrypted.

Even we can’t grab your passwords. That’s how secure it is !

Passket

A Secure yet Transparent way to store your password

- Uses NextJS + React as Rendering Frameworks
- MongoDB as Database
- Supabase for Authentication System
- Python as Backend
- Uses API as communication between React and Python

Passket

A Secure yet Transparent way to store your password

Through this mini-project, we could learn

- Authentication Flow of the website
- Encryption standards and best practices
- Effective use of APIs
- UI/UX Design and Development
- Best Practices of Database and structures

Passket

A Secure yet Transparent way to store your password

Our objective is to learn new technologies and frameworks.

Privacy and Data is very valuable in this era and it should be secured much safer. That’s how Passket exists ;)

Want to have a peek ? Look at our GitHub repository of the code !

Yes, we strictly followed GitHub as our version control and learned a lot about it.
